

Garage door controller

Your Garage door has two modes of operation

- 1, Externally it is opened by the remote control button marked with 1 dot.
- 2, Internally the door operates by driving over the marked area approximately 5 meters back from the gate.

The door takes approximately 10 seconds to cycle open.

The door stays open for 20 seconds for you to exit.

The door has sensors so that any vehicle or pedestrian crossing the gate threshold will either stop the gates closing and return them to the open position or hold them in the open position.

The gates are set so that they cannot crush a vehicle or car; if they meet any resistance they cycle to open position again.

In the event of gate failure such as loss of power, we have provided you with an emergency release key. The construction site team will demonstrate this; further demonstrations may be arranged with the management company.

If you encounter any problems during your warranty period then please contact our customer care team, when out of warranty the property management company will resolve any issues.

Additional key fobs can be ordered from the gate installers, please contact:
